

eprentise

eprentise software changes underlying setups – chart of accounts, calendars, or operating units and maintains all history in Oracle E-Business Suite. eprentise consolidates or separates data for acquisitions, or divestitures. For information, visit www.eprentise.com.

What are you showcasing at Symposium/ITxpo?

eprentise produces software for customers who run Oracle E-Business Suite. eprentise software allows customers change the underlying setups such as chart of accounts, calendars, operating units, or to merge legal entities or ledgers, eprentise software changes all history in all Oracle modules to reflect the new setups. eprentise also consolidates multiple E-Business Suite instances for a centralized data center or for a merger or acquisition, or separates data for a divestiture. Oracle E-Business Suite customers change their existing applications with eprentise so that they can upgrade to R12 rather than reimplement. Using eprentise software is less than half the time and cost than a reimplementation effort.

What business problem does your company solve?

eprentise helps organizations that run Oracle E-Business Suite (EBS) by providing Transformation software. These customers have particular Oracle-related challenges when their business changes and they want their Oracle instance or instances to follow and support the new “release” of the business.

The complexity of EBS meant that customers had few options other than reimplementing if they wanted to keep their systems aligned with the business changes. A series of reimplementations is not only costly, it is unnecessary.

eprentise Transformation software was architected from the ground up with the purpose of providing enterprise agility to organizations that rely on OEBS for their financials and day-to-day operations, allowing them to change their EBS installation as the business changes, and maintain all history.

What would CIOs find interesting about your products or services?

eprentise is a software suite – not services. eprentise software analyzes an Oracle E-Business Suite (EBS) so that it can automatically generate the code to change, copy, filter, or merge any data, anywhere in the Applications. Using eprentise software reduces the time and costs and eliminates the technical risks of changing underlying data in Oracle E-Business Suite or of reimplementing EBS. All data is changed, eliminating the need to and costs of maintaining a sunset environment and pointers for history. Customers define a target and then use eprentise software to make the necessary changes from the source to the new target environment so that Oracle E-Business Suite is re-aligned to the business. Because it is software, customers also have the flexibility of changing the required target environment many times until the users agree that the resulting EBS supports the business and streamlines operations.
